

Compulsory modules:

INS IN Introduction to Neuroscience	Einführung in die Neurowissenschaften	Compulsory module	13 CP = 390 h		10 SWH
			Contact study 10 SWH / 150 h	Self study 240 h	
Content					
<p>Series of lectures on selected topics in neurosciences I (WS) Content: Cellular, molecular and physiological background to the function of nerve and glia cells. Mechanisms of signal transduction. Plasticity, learning, memory, sensory systems, motor control, nervous system function, basis of cognition, development of the nervous system, rhythmic control of nerve function and anatomy of the human brain.</p> <p>Series of lectures on selected topics in neurosciences II (SS) The lectures go into more detail about specific aspects of experimental neurology, pathology and diagnostics, including non-invasive analyses of the human brain, degenerative diseases of the nervous system and medical psychology as well as methodological developments, e.g. optogenetics.</p> <p>Seminars relating to the lectures in selected topics in neurosciences I and II The students will assess research papers relevant to the lectures</p> <p>Introductory sessions Introducing neurobiology research in Frankfurt. Presenting the Master's programme.</p> <p>Colloquium Participating in 7 neurobiology oriented colloquia at the institutes</p> <p>Weekend seminar Presenting and discussing research projects within the Master's programme; thematisation of ethical and legally relevant aspects in the neurosciences</p>					
Objectives					
The students gain broad interdisciplinary background knowledge about neurosciences and their possible applications. They learn about neuroscientific research concepts and should be in the position to link together various specific areas and paradigms in neurosciences. They will be able to critically assess scientific research papers in the form of an oral presentation.

INS BM Introduction into Basic Methods in Neuroscience	Einführung in Basismethoden der Neurowissenschaften	Compulsory module	13 CP = 390 h		11 SWH
			Contact study 11 SWH / 165 h	Self study 225 h	
Content					
<p>The module focusses on the following areas:</p> <p>(1) <u>Methods of cell biology, molecular biology and genetics</u>: Imparting of knowledge on practical and theoretical basics for working with chemical solutions, physical-chemical features of proteins and their isolation, subcellular fractioning and centrifugation, preparation of cell cultures, immune-histology and microscopy and the basic principles of molecular genetics and genomics.</p> <p>(2) <u>Anatomy of the central nervous system</u>: Using slices, plastic models and stored data-sets the structure and the development of the human brain and spinal cord are shown, including the autonomous nervous system and the cerebral blood supply. Furthermore imaging methods like MRI and fMRI are introduced. Also the evaluation of brains and animal model organisms are discussed.</p> <p>(3) <u>Electrophysiology</u>: In lectures and seminars/discussions the basics of membrane potentials, action potentials, forwarding of potentials, synaptic morphology/geometry/function are dealt with. Important methods for recognition and analysis of single neurons (extracellular, intracellular, patch-clamp) and neural networks activity are discussed. Both electrical and optical techniques of neural stimulation are presented.</p> <p>(4) <u>MATLAB-programming and statistics</u>: Basics of programming of neural data recordings and analysis with MATLAB are discussed. A focus lies on practical programming exercises. Basic statistical methods are introduced, discussed and realised in MATLAB.</p> <p>(5) Legal and ethical aspects of animal experimentation, genetic manipulations, biological safety and proper scientific conduct are imparted.</p>					
Objectives					
<p>Within this module the students learn to discuss intensely and independently theoretical as well as practical contents of the study. They attain practical competence in cellular and molecular lab techniques, cell culture techniques and programming of neuro-biological questions in MATLAB. When having finished the module they have basic knowledge on neurogenetics. They have fundamental knowledge on human brain anatomy as well as animal models, can identify important cerebral structures and interpret histological preparations adequately. They possess basic knowledge regarding neural potentials and synaptic mechanisms and can assess potentialities and limitations of electro-physiological technologies. They can apply adequate statistical methods in assessing significance and comparison of neural records. They will attain competence regarding rules of good scientific practice, and to keep the directives regarding genetic works, bioassay practices, and animal welfare.</p>

INS MN Methods in Neuroscience	Einführung in neurowissenschaftliche Arbeitstechniken	Compulsory module	15 CP = 450 h				15 SWH	
			Contact study 15 SWH / 225 h		Self-study 225 h			
Content								
The module is a practical on “Introduction to scientific research techniques”. The aim is to teach the students as much as possible about the most important experimental techniques recommended for the specialised topics of their Master’s project so that their thesis work can be completed successfully in the time available.								
Objectives								
After completing the module, the students will be familiar with the basic techniques that apply directly to a Master’s project in their chosen topic. They will be able to efficiently find information about methods from publications and the Internet and evaluate the feasibility of experimental designs. They will be competent in criticizing methods and assessing artefacts.								
Requirements for participating								
Successful completion of the module “Introduction to Neurosciences” and the module “Basic Methods in Neuroscience” as well as at least 2 out of the 3 elective modules								
Helpful previous knowledge:								
Assignment of module (course/department)					Interdisciplinary Neuroscience / FB15			
Suitable for other courses					no			
Times offered					As of 3 rd semester of the course			
Duration					6 weeks

			Contact study 16 SWH / 245 h		Self-study 235 h			
Content								
<p>The module includes a practical project and a seminar that aims to provide the students with the most important theoretical background for developing a research concept in one neurobiological topic. After working on recent scientific papers, they should identify critical unanswered questions as well as develop research strategies to solve them.</p> <p>Weekendseminar: Presentation and discussion of research projects in the neurosciences; thematisation of ethical and legally relevant aspects in the neurosciences</p>								
Objectives								
<p>After completing the module, the students will be familiar with developing scientific research concepts as well as how to incorporate these into grant applications. The students will develop critical skills to assess the relevance and validity of different or even contradictory theories and research concepts.</p> <p>The students attain competence regarding rules of good scientific practise, and ethical aspects of topical methods in neuroscience like neural stimulation or neuroenhancement. They will attain topical knowledge concerning bioassay practise, protection of animals directives and animal welfare act.</p>

INS MA Masterthesis	Masterarbeit	Compulsory module	30 CP = 900 h		30 SWH			
			Contact study 30 SWH / 450 h	Self-study 450 h				
Content								
As part of the Master’s degree a student uses scientific methods to work intensively and in detail on a particular question for a period of 6 months. The work can be experimental, empirical or analytic. The results must be written up in a Master’s thesis in the style of a scientific paper. The quality of the work will be assessed based on the written thesis by the supervisor and a second referee.								
Objectives								
The students will be able to work intensively and in detail on a scientific question. They will have learned practical application of modern research methods and how to produce a written work in the style of a scientific publication.								
Requirements for participating								
Proof of at least 79 CP								
Helpful previous knowledge:

INS A-0 External Practical Module “Basic Neuroscience”	Externes Praxismodul „Neurowissenschaftliche Grundlagenforschung“	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical provides basic methods and technologies in basic research in the neurosciences. The students work on own topical projects under instructions and introduce the results in the form of a seminar talk. They learn how to present scientific work through writing up an appropriate result protocol.</p> <p>The module can be offered by departments of the Goethe university, from other universities in Germany and foreign countries as well as by external-university research facilities.</p>							
Objectives							
<p>The students gain knowledge in the realisation of neuro-biological experiments in the area of basic research. They learn working independently on scientific questions based on relevant publications.</p>

INS A-1 Cellular and Molecular Basis of Signal Transfer in the Nervous System	Zelluläre und molekulare Grundlagen des Signaltransfers im Nervensystem	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Offered until summer semester 2016							
Content							
<p>The practical focuses on basic techniques used in cellular and molecular neurobiology. The students work on their own project with supervision, and present the results in the form of a seminar talk. In another seminar talk they assess an original piece of research from the field of cellular and molecular neurobiology. They learn how to present scientific work through writing up an appropriate result protocol. The main topics are: protein biochemistry methods to study nerve function, including subcellular fractionation, the basics of working with neuronal cell culture, cell transfection, and cytology of cultured cells and tissue sections from the brain, as well as working with digital images.</p>							
Objectives							
<p>Familiarity with isolating neuronal cell organelles, independently characterising organelle proteins, sterile work and cultivation and transfection of cells, independently using a fluorescence microscope and computer-aided evaluation of lab data and image data, familiarity with anaesthetising lab animals, independently working on scientific questions based on relevant publications.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical teaches fundamental methods in auditory neuroscience such as neurophysiology, neurohistology and biomechanics in different animal models, like mammals, humans and insects. The students work on their own projects, like brain stem response measurements in tinnitus animals, otoacoustic emissions, nanomechanics of hearing organ motion or enzyme staining of brain slices with supervision. At the end, students will present their results in the form of a seminar talk. In a further seminar talk they present an original piece of research from the field of auditory neurobiology. They learn how to present scientific work through writing up an appropriate result protocol.</p>								
Objectives								
<p>Familiarity with carrying out electrophysiological experiments, measuring otoacoustic emissions, familiarity with anesthetizing and surgical procedures in animal experiments, application of neuroanatomical techniques, learning how to work on scientific questions based on relevant publications.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
The practical presents the basics of generating endogenous circadian rhythms in mammalian neurons. Here, the students analyze the cellular and molecular elements for chronobiological behaviour, working under supervision, and write up the results. Then the results obtained are presented in the form of a seminar talk. In a further seminar talk they present original research from the area of chrononeurobiology. The following techniques will be introduced: immunohistochemistry, protein gel electrophoresis, RNA extraction, RT-PCR, densitometry.							
Objectives							
Basic knowledge about cell and molecular biology, basic skills in neuroanatomy of the mammalian brain, basics in chronobiological systems biology, learning to work on scientific questions based on relevant publications.

INS A-7 Neurobiology of the Nematode <i>Caenorhabditis elegans</i>	Neurobiologie des Nematoden <i>Caenorhabditis elegans</i>	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>This practical focuses on basic methods for investigating the nervous system of <i>Caenorhabditis elegans</i>. As well as more general molecular biology methods, this involves genetic methods (crosses, genotyping) as well as simple behaviour assays without and with the effect of specific agonists for ligand mediated ion channels (nicotinic acetylcholine receptors, GABA receptors) that are used for general characterization of the function of neuromuscular synapses. In addition, cell biology methods for expression analysis of transgenes (GTP-fusion proteins) or endogenous proteins (using specific antibodies) in relation to the genetic background are part of the lab's standard repertoire. More specialised methods that are used are exogenous stimulation of neurons in <i>C. elegans</i> by light, transmitted by the transgene expressed, photo-activated cation channel rhodopsin-2, as well as electrophysiological conductance from <i>C. elegans</i> muscle cells (the latter only as a demonstration, since the method is too complicated to learn in 6 weeks).</p> <p>The students work on a current research project under the supervision of a PhD student and present the results in the form of a seminar talk. They learn how to present scientific work through writing up their result protocol.</p>							
Objectives							
Familiarity with standard methods to analyse an invertebrate nervous system, genetic methods for making crosses, cell biology methods, molecular biology methods, learning to work on scientific questions based on relevant publications.

INS A-8 Neuropharmacology	Neuropharmakologie	Elective module	11 CP = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>This module teaches principles and methods of neuropharmacology. Our lab works with animal models of neurodegenerative disease such as stroke and dementia of the Alzheimer type. We use in vitro- as well as in vivo-methods, with a focus on microdialysis which allows access to the extracellular fluid. In demonstrations and experiments, students will be trained to manufacture probes for microdialysis studies and will carry out measurements of neurotransmitters (e.g. acetylcholine, glutamate) and energy metabolites (glucose, lactate). Major topics will include investigations of the central cholinergic system and of the energy metabolism in the brain under ischemic conditions.</p> <p>The students will write protocols for their own work and will analyze their data both graphically and statistically in a way that would permit publication; thus, the students will learn basics of scientific work. The individual projects will be presented as seminar talks at the end of the module. In a further seminar talk, they will present an original piece of research (publication) from the field of neuropharmacology.</p>								
Objectives								
Familiarity with biological and analytical experiments, basic knowledge in animal experimentation. Theory and practice of microdialysis, analysis of neurotransmitters and metabolites with chromatographic (HPLC) and enzymatic procedures. Addressing scientific questions with the help of relevant literature.								
Requirements for participating

INS A-9 Cellular Physiology of Dopaminergic Neurons	Zelluläre Neurophysiologie dopaminerger Neurone	Elective module	11 CP = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical covers basic electrophysiological single cell techniques (patch-clamp recordings & extracellular electrodes) of the dopaminergic midbrain system of mice <i>in vivo</i> and <i>in vitro</i>. The students work on their own projects under supervision and present their results in the form of a seminar talk. In a further seminar talk they present an original piece of research from the field of basal ganglia neurophysiology and pathophysiology (e.g. Parkinson's disease, schizophrenia, drug addiction). The main focuses are measuring and evaluating neuronal activity (current-clamp) and measuring (voltage-clamp) as well as biophysical and pharmacological characterisation of this neuronal activity mediated by synaptic and post-synaptic mechanisms (e.g. ion channels) with various configurations of the patch-clamp technique. This also includes using statistical evaluation methods. The students learn about the associated stochastic background and how to use the relevant software, which involves interdisciplinary cooperation with the BSc/MSc courses in mathematics.</p>								
Objectives								
<p>Familiarity with carrying out electrophysiological experiments, measuring and analysing electrical activity of dopaminergic neurons <i>in vivo</i> and <i>in vitro</i>, using and evaluating the patch-clamp technique to characterise biophysical and pharmacological properties of synaptic and post-synaptic ion channels. Combination of the patch-clamp technique with neuroanatomical and immunohistological analyses. Basic computer modelling of neuronal activity. Stochastic description and statistical analysis of the recorded time sequence data. Understanding the molecular pathophysiological correlation between important diseases of the dopaminergic system and their corresponding mouse models.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical investigates the neurophysiological basis of behaviour control. The students work on their own project on a theme defined together beforehand. The techniques that are taught include: cell physiology (patch-clamp conductance, intracellular conductance, calcium imaging, cell culture); neuroanatomy (staining methods, brain preparation, confocal laser microscopy, fluorescence microscopy); behavioural experiments (behaviour pharmacology, extracellular conductance, learning and memory, social behaviour). Insects (honey bees, drosophila) are used as model organisms. The principle areas are: how ion channels and transmitter receptors work, neuromodulation, learning behaviour, olfactory memory formation, and social behaviour of bees.</p> <p>The students present their results in the form of a seminar talk and poster. In a further seminar talk they learn how to critically assess analytic physiological and behavioural research papers. These presentations are held in English and the students receive comprehensive feedback about the content and style of the presentation. They become familiar with writing a scientific publication by producing a protocol in the form of a paper.</p> <p>After the individual experimental steps have been explained, the students mostly work independently, from planning to carrying out, writing up and evaluating the research data.</p>								
Objectives								
<p>Planning, carrying out and evaluating neurobiology experiments, measuring ion flow; observing and quantifying behaviour; neuroanatomical methods. How to approach scientific questions, working with publications. Preparing scientific papers and presentations.</p>

Offered until summer semester 2016								
Content								
<p>The practical course offers basic theoretical and experimental knowledge in the area of developmental neurobiology. Principal areas of research are the development and plasticity of the synapse as well as migration of neurons during cortex development. The students take part in ongoing experiments in the laboratory to elucidate the molecular mechanisms of these processes. Their work includes: basic mouse genetics techniques and the handling of a mouse colony, processing of brain tissue for <i>in situ</i> hybridisation and immunohistochemistry, isolation of primary hippocampal and cortical neurons from mice, transfection of primary neurons, immunofluorescence microscopy, confocal microscopy, Biochemical techniques including protein gel electrophoresis, Western blotting and immunoprecipitation.</p> <p>The results of the practical course are presented by every student in the form of a written protocol and a talk at the end of the course. The students also take part in the weekly lab meetings where they learn about the ongoing research of all the members of the group. In a Journal Club every student presents a recent publication in the field of their own projects.</p>								
Objectives								
Students learn the basic techniques for studying cellular and molecular neurobiology (as detailed above). By the end of the course they have been in direct contact with mice and learn how to handle a mouse colony. The students are in an international environment and learn how to write and communicate their results in English.

Content							
<p>The practical course offers basic theoretical and experimental knowledge in the area of the brain vasculature in developmental and pathological neurobiology. Principal areas of research are the development and maintenance of the blood-brain barrier (BBB), and its relevance for neuronal function. The students take part on ongoing experiments in the laboratory to elucidate the molecular mechanisms of BBB formation. Their work may include: basic mouse genetics techniques and the handling of transgenic mice (various reporter mouse strains for the Wnt pathway as well as conditional/inducible gain- and loss-of-functions strains), processing of brain tissue for in situ hybridization and immunohistochemistry, isolation of primary cortical microvessels from mice, transfection and infection techniques, immunofluorescence, confocal and live-cell microscopy, biochemical techniques including protein gel electrophoresis, Western blot and immunoprecipitation.</p> <p>The results of the practical course are presented by every student on the form of a written protocol and a talk at the end of the course. The students also take part on the weekly lab meetings where they learn about the ongoing research of all the members of the group. In a Journal Club every student presents a recent publication on the field of their own projects.</p>							
Objectives							
<p>Students learn the basic techniques to study cellular and molecular Neurobiology (as detailed above). By the end of the course they have been in direct contact with mice and/or cells in vitro and they learn how to appropriately handle mouse tissue and cells for experiments. The students are in an international environment and learn how to write and communicate their results in English.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>Topic of this practical course are principles of neurogenesis in vertebrates, with special focus on cell intrinsic mechanisms governing cell fate specification and differentiation of adult and embryonic stem- and progenitor cells in the brain.</p> <p>The students work on their own projects with supervision and present their results in the form of a seminar talk. In addition, one original publication from recent literature relevant to his/her research project will be presented and discussed. The results obtained during the course will be recorded in a written results protocol either in the form of a short research paper or of a short grant application in order to allow the students to gain first practical experience in these two important forms of scientific writing.</p>								
Objectives								
<p>The practical course teaches basic techniques in cellular and molecular developmental neuroscience. Model organisms used are mice and chick embryos. Emphasis will be placed on retroviral gene transfer <i>in vivo</i> and <i>in vitro</i>; working with cell lines and primary cell cultures (embryonic and adult neural stem and progenitor cells); biochemical techniques (sub cellular fractionation, protein purification); immunohistochemistry, in situ hybridization; working with transgenic animals.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
This practical will introduce students to the techniques used to examine neural activity in freely behaving animals. Students will record neural activity extracellularly from the hippocampus of mice performing a spatial working memory task and analyze the neural data in relation to the animal's behavior. Students will learn how to train animals to perform a behavioral task, how to perform extracellular recordings in freely behaving animals; how to extract the spiking of individual neurons as well as local field potentials from the neural data; and how to analyze these signals in relation to each other and the animals' behavior. Students will present the data they have collected and analyzed at the end of the practical. In addition, they are required to present one recent paper that is relevant to the work in a journal club.							
Objectives							
Behavioral training; basic knowledge of techniques used to record and analyze neural activity from freely behaving animals; ability to generate scientific hypotheses based on previous literature and design experiments to test them.

INS A-17 Auditory Function and Dysfunction: Behavior and Physiology	Gestörte Wahrnehmung beim Hören: Verhaltensuntersuchungen und Physiologie	Elective module	11 CP (insg.) = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical teaches techniques to determine auditory function and dysfunction in rodents. These techniques can be used to determine effects of pharmacological or behavioral treatments of sensory disorders such as tinnitus or hearing loss. The focus is on behavioral techniques suitable to characterize the disorder rather precisely in comparison to normal functions. All steps that are necessary for a project in the field are taught in this practical: study design, animal handling, control of experimental parameters, pharmacological treatment of animals, and data analysis. The behavioral analysis is paralleled by basic electrophysiological measurements necessary to determine the effects of dysfunction and treatments at the physiological level. The students work on their own projects under supervision and present their results in the form of a seminar talk. The main focuses are: measuring and analyzing behavioral data, performing efficient physiological experiments to determine auditory function, and statistical evaluation methods. Preparation of a potential publication will be the final part of the project. After completion, the individual projects will be presented and discussed in the form of a seminar talk. In a further seminar talk the students will present an original piece of research from the area of cognition and hearing.</p>								
Objectives								
<p>Familiarity with carrying out well controlled behavioral experiments (animal handling, measuring and analyzing behavioral data, statistical analysis). Performing physiological measurements including electrophysiological recording in minimally invasive preparations. Additional aspects are: introduction to software for data handling, signal processing, and graphical display. Deriving scientific questions from the current literature. Knowledge about the usage and limitations of animal models for neurological diseases.</p>

Content								
<p>The practical covers the whole range of techniques to investigate brain activity underlying the processing of sensory information in the auditory domain. The focus is on electrophysiological single cell techniques in rodents in the awake and anesthetized preparations. Brain activity is acquired and analyzed with the goal to understand behavioral responses following auditory stimulation. Cognitive aspects (e.g. context-dependence) are taken into account. The students work on their own projects under supervision and present their results in the form of a seminar talk. The main focuses are measuring and analyzing neuronal activity in different configurations of in-vivo recording techniques. The following analysis includes modern techniques of signal processing, efficient handling of larger data sets and statistical evaluation methods. Preparation of a potential publication will be the final part of the project After completion, the individual projects will be presented and discussed in the form of a seminar talk. In a further seminar talk the students will present an original piece of research from the area of cognition and hearing.</p>								
Objectives								
<p>Familiarity with carrying out physiological experiments (animal handling, surgery, measuring and analyzing electrical activity at the single neuron level. Combining physiology with neuroanatomical and histological staining techniques. Basic introduction to behavioral control. Introduction to software for data handling, signal processing, statistical analysis and graphical display. Understanding cognitive influences on sensory information processing as an important aspect of context-dependent behavior. Deriving scientific questions from the current literature.</p>

INS A-19 Neuronal basis of acoustic communication in mammals	Neuronale Grundlagen der akustischen Kommunikation bei Säugetieren	Elective module	11 CP (insg.) = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The main goal of this course is to understand how mammals communicate using acoustic information (sounds). The course is designed from the perspective of the “broadcaster-receiver” approach, and therefore it is consequently subdivided into two parts. The first part is meant for understanding the sounds broadcasted by two mammalian species (Mongolian gerbils and bats) while they are communicating. Basically, using bioacoustics tools, the students will try to figure out the vocal alphabet of bats and gerbils. The second part of the course deals with the receiver. In this part, the students will learn how the gerbil’s voice is processed in the brain by neurons located in the auditory cortex. The main aim here is to assess what happens in the brain when an animal hears a behaviorally relevant sound. At the beginning of each course part, there will be introductory discussions that will provide the students with the necessary theoretical background for conducting and understanding the different experiments. An introduction to statistics and to MATLAB will also be offered. The final report will be written in the form of a scientific paper, and the results will be presented in the form of a short talk.</p>								
Objectives								
<p>By the end of the course, the students should be able to: (1) Understand basic concepts of bioacoustics such as the sound as a mechanical wave, sound transduction using microphones, analog-to-digital conversion using sound cards. (2) Measure basic parameters of a sound wave (frequency, duration, intensity). (3) Perform basic surgeries required for acquiring neuronal data. (4) Understand basic neuroscience concepts such as: action potential, local field potential, receptive field, brain topography, spike clustering, brain oscillations. (5) Testing hypothesis using basic statistical tests (normality tests, parametric and non-parametric t-tests and analyses of variance (ANOVA)).</p>

			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical provides an introduction to current topics in the field of mammalian learning and memory. The students work on their own projects under supervision. Using in vitro patch-clamp recordings in slices of mouse auditory cortex, the students will characterize the basic properties of different, genetically-identified cortical neurons. In a second step, they can participate in ongoing experiments in the lab that address the circuit mechanisms of auditory fear learning and memory expression in vivo. The results are recorded in the form of a protocol and presented as a seminar talk. In a second seminar, the students present a recent research paper from the area of learning and memory.</p>								
Objectives								
<p>The participants will learn the practical realisation, the planning and evaluation of electrophysiological experiments on the subject Learning and Memory. Besides they are introduced by discussions and own presentation in up-to-date questions in this field of research.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical course offers basic theoretical and experimental knowledge in the area of cellular, molecular and systemic neurobiology in mouse and zebrafish. The students work on their own projects under supervision and present the results in the form of a seminar talk. In a second seminar talk they present an original publication from the field of their projects. By writing a result protocol, they will learn how to write scientific reports.</p> <p>The practical course is divided in two units. The first part includes the following tasks: basic mouse genetic techniques, processing of brain tissue for immunohistochemistry, basic techniques of working with neuronal cell cultures, immunofluorescence microscopy, confocal microscopy, and biochemical techniques including protein gel electrophoresis and Western blotting. In the second part of the practical course, the students will be introduced to basic zebrafish genetics using methods in molecular biology and histological techniques, confocal microscopy and brightfield microscopy as well as zebrafish embryo manipulation and basic behavioral tests.</p>							
Objectives							
<p>Students learn the basic techniques for studying cellular, molecular, and systemic neurobiology (as detailed above). They work with cultured cells under sterile conditions, with the epifluorescence microscope and the stereo microscope. The students will be trained in zebrafish embryo handling and basic genetic techniques, and quantify and analyse the obtained data and images. The students are in an international environment and learn how to write and communicate their results in English.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The aim of this practical module will be to introduce students to optogenetics and fiber photometry techniques in freely behaving animals performing behavioral tasks. The students will learn how to perform chronic surgeries for viral injections and optical fiber implantations; how to perform behavioral tasks; how to run optogenetic experiments in freely behaving animals; how to perform calcium recordings in freely behaving animals using fiber photometry; and how to analyze calcium signals in relation to animal's behavior. The optogenetic manipulations and calcium recordings will mainly be performed in the midbrain dopamine system while animals perform behavioral tasks such as reward learning paradigms. At the end of the module, the students will present the results of the experiments they performed.</p>							
Objectives							
<p>The students will learn the basics of performing behavioral tasks and optogenetic and calcium recording experiments in freely behaving animals. They will learn how to design experiments to test specific hypotheses.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical provides basic methods and technologies in clinical neurosciences. The students work on own topical projects under instructions and introduce the results in the form of a seminar talk. They learn how to present scientific work through writing up an appropriate result protocol.</p> <p>The module can be offered by departments of the Goethe university, from other universities in Germany and foreign countries as well as by external-university research facilities.</p>								
Objectives								
The students gain knowledge in the realisation of experiments in the area of clinical neurosciences. They learn working independently on scientific questions based on relevant publications.

Content							
The practical course introduces basic analysis techniques for mouse models of the neurodegenerative diseases Parkinson's and ataxia. The students are trained in objective methods to measure motor and behaviour patterns (Offenfeld, Rotarod, etc.), statistical evaluation for progression analyses (ANOVA, Regression, etc.) as well as molecular genetic mutation tests (tail biopsy, DNA extraction, quantitative PCR) and analysing the expression profile of mutated tissue. They work on current projects under supervision, report on up to date science in a Journal Club, and present the experimental results in the form of a seminar talk. They learn how to present scientific work through writing up a result protocol.							
Objectives							
Basic knowledge about designing and carrying out motor-behaviour analyses in rodents as well as statistical evaluation. Learning methods in cell biology (fibroblasts/cell culture, transfection), molecular genetics/biology (quantitative PCR, Western blots), histological methods, learning to work on scientific questions based on relevant publications.

			Contact study 11 SWH / 165 h		Self-study 165 h			
Offered until winter semester 2015/16								
Content								
<p>The practical focuses on basic methods for investigating the mechanisms of how pain arises and particularly the pharmacology of this in various human, animal and cell culture models. Under supervision the students perform and document the experiments themselves in small groups. At the end of the practical the results are presented and discussed in a seminar talk. Current topics in pain research are presented and discussed in a Journal Club accompanying the practical, where each student prepares a talk on an recent research paper.</p>								
Objectives								
<p>Familiarity with human pain models, observing the behaviour of experimental animals and presenting various pain models, preparing tissue for immunohistochemistry and Western blots, setting up neuronal cell culture, introduction to calcium imaging, measuring primary sensory neurons and pharmacological effects, learning about <i>in vitro</i> cell culture models for investigating the pharmacology of inflammation mechanisms, measuring inflammation mediators in a cell culture model, preparing scientific papers, preparing one's own results in the form of a talk and written protocol.</p>

INS B-4 Plasticity in Hippocampus – Morphology, Physiology, and Clinical Relevance	Plastizität im Hippocampus – Morphologie, Physiologie und klinische Relevanz	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical and seminars provide an interdisciplinary overview of the plasticity of the hippocampus. Physiological experiments include conductance of electrical potential <i>in vivo</i> in hippocampal sections and section cultures, as well as how they are affected by electrical stimuli and pharmaceuticals. The aim is to learn the various standard techniques for analysing hippocampal plasticity and comparing how they are applied in research. Anatomical experiments demonstrate analyses of changes in cellular morphology following central nervous system damage, or neuronal over-stimulation.</p> <p>The accompanying seminars compare the experimental models used for neurological diseases. The relevance of animal experimental models for understanding human diseases are discussed using examples from recent research papers.</p>							
Objectives							
Basic electrophysiological and anatomic techniques; preparing tissue slices and organ-specific slice cultures; confocal microscopy; learning how to work on scientific questions based on relevant publications.

Content								
The practical investigates neurological questions in children. The main themes are developmental neurobiology in the first year of life, applied neurophysiology in children, neuropaediatric medicine including epilepsy syndromes and neurotraumatology. The students take part in relevant investigations, write up an experimental protocol and present their results in the form of a seminar talk. They give an additional seminar talk on recent original research papers.								
Objectives								
Familiarity with standard methods in clinical neuropaediatrics, acquiring experience in handling patients as well as classifying typical clinical symptoms, learning how to work on scientific questions based on relevant publications.								
Requirements for participating

Content							
<p>The practical provides an introduction to basic image analysis, image interpretation and acquiring data by examining the CNS (cerebral and spinal) with neuroradiological imaging procedures. The following procedures are used: molecular resonance tomography (MRT) of the head and spinal column, computer tomography (CT) of the skull and spinal column, digital cerebral and spinal subtraction angiography (DSA) as well as an introduction to basic neuroradiological intervention measures.</p> <p>In addition, the practical presents the theoretical / physical background to individual analysis procedures in neuroradiology focussing on nuclear resonance tomography. This will deal with the physical basis of MRT / image composites, sequences and sequence parameters of MRT, diffusion and perfusion weighted MRT imaging, tractography (fibre tracking), functional MRT (fMRT), nuclear resonance spectroscopy analysis (MR spectroscopy).</p> <p>The students compile a written protocol on the investigations carried out and present this along with the theoretical background in the form of a seminar talk.</p>							
Objectives							
Familiarity with neuroanatomy (cerebral/spinal) as well as the skull and spinal column; basic knowledge about relevant neurological diseases. Learning about indications for neuroradiological examination, acquiring and interpreting images as well as assigning them to typical individual clinical pictures.

INS B-9 Clinical Auditory Neuroscience	Klinische Auditorische Neurowissenschaften	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical teaches most important basics of objective and subjective audiometric measurement techniques to assess hearing disorders. Pure tone and speech audiometry as well as clinical application of otoacoustic emissions, impedance measurements of the eardrum, and different methods of auditory brainstem response recording (BERA, CERA, ASSR, MMN) shall be demonstrated. The fitting of implantable hearing aids and cochlear implants will be shown in different patients. Intra-operative assessment of neuro-physiological auditory responses will be also part of the practical.</p> <p>The students work on their own projects with supervision, and present their results in the form of a seminar talk. In a further seminar talk they present an original piece of research from the field of neuro-physiological stimulation/recording of auditory responses. They learn how to present scientific work through writing up an appropriate result protocol. The main topics are: psychoacoustic measurements of auditory perception with electrical stimulation by means of cochlear implants, investigation of different recording techniques to assess frequency specific responses of the auditory system, use of computer/software in evaluating data and generating stimuli.</p>							
Objectives							
Familiarity with carrying out psycho-acoustical experiments, measuring auditory brainstem responses, basics of audiometry, learning how to work on scientific questions based on relevant publications.

			Contact study 11 SWH / 165 h		Self-study 165 h				
Content									
<p>The aim of this practical is to introduce students to a wide-range of experimental techniques that are used to study psychiatric disorders from the bench to the bedside. The wide variety of translational projects that students can participate in include cell culture techniques to functionally evaluate gene candidates identified from studies in large cohorts of patients, the assessment of the effect of drug targeted, viral vector targeted or knockout mice in behavioural tests relevant for psychiatric disorders. After such experiments, a variety of immunohistochemical and histological characterisations are performed. There is also the possibility to gain insight into how neuroimaging methods, such as functional magnetic resonance imaging, electroencephalography and magnetoencephalography are used to assess aberrant neural processing and coordination in psychiatric disorders.</p>									
Objectives									
<p>Students will receive training in a range of molecular and behavioural techniques commonly used to study psychiatric disorders and design experiments using the knowledge gained. They will also receive basic knowledge about the disorders, particularly mood and anxiety disorders, schizophrenia and attention-deficit hyperactivity disorder, in a series of seminars and journal clubs (including the option to participate in case presentations).</p>

Elective Modules Subject Area C: Cognitive and computational neuroscience

INS C-0 External Practical Module “Cognitive and theoretical Neuroscience”	Externes Praxismodul „Cognitive und theoretische Neurowissenschaften“	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical provides basic methods and technologies in the area of cognitive and theoretical neurosciences. The students work on own topical projects under instructions and introduce the results in the form of a seminar talk. They learn how to present scientific work through writing up an appropriate result protocol.</p> <p>The module can be offered by departments of the Goethe university, from other universities in Germany and foreign countries as well as by external-university research facilities.</p>							
Objectives							
The students gain knowledge in the realisation of experiments in the area of cognitive neurosciences and/or in computational modeling of neurobiological questions . They learn working independently on scientific questions based on relevant publications.

			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The practical focuses on non-invasive techniques for measuring brain activity in humans that have significantly influenced recent cognition research. This includes functional magnetic resonance tomography (fMRT), EEG, including stimulation correlated potentials (SCP), and magnetic encephalography (MEG). Following a theoretical introduction to the basics of each method, the students carry out their own experiments on central cognitive functions such as perception, attention, working memory and speech. They should be made aware of the advantages and disadvantages of each method and learn the main steps in evaluating the results. The project topics should be related to current projects in the participating research groups in cognitive neurology and the Institute for Medical Psychology who are responsible for supervising the students. The results should be presented in the form of a seminar talk. A protocol should be written up in the style of a scientific paper. In an additional seminar talk the students should present and critically assess recent published research on a related theme.</p>								
Objectives								
<p>Basic knowledge about the design and carrying out of cognitive experiments in humans, learning about relevant physiological methods (fMRT, EEG, MEG), learning about working on scientific questions based on relevant publications.</p>

Content									
<p>This module is equivalent to the module M-SIM 1c: Modellierung und Simulation 1, offered in the Master course “Informatics”, Faculty 12 (Computer Science and Mathematics). It consists of a lecture (SIM1) and a practical course (SIM1-PR). The lecture imparts: 1) Introduction to vector analysis: functions of several variables, derivatives and integrals, integral theorems. 2) Modeling: Modeling approaches, conservation equations, constitutive relations. 3) Simulation methods:</p> <p>a) Finite-difference methods for ordinary differential equations: consistency, convergence, stability. b) Discretisation methods for partial differential equations: Finite differences, finite elements.</p> <p>The practical offers complementary programming work to the lecture.</p>									
Objectives									
Familiarity with the basics of modelling and numerical simulation									
Requirements for participating

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical and seminars provide an overview of computational and mathematical modeling of neural systems specifically focusing on modeling neurons and networks of the hippocampus. The course is an entry to the theoretical methods and approaches used to model the brain at different levels, ranging from synapses and dendrites to neurons and neural circuits. The aim is to learn standard techniques for building, managing, and using models that are closely linked to experimental data, especially those that involve hippocampal cells with complex anatomical and biophysical properties. Computational (in silico) experiments include large-scale network simulations in biophysically realistic and data-driven models of the hippocampus as well as single-cell simulations in morphologically reconstructed hippocampal neurons.</p> <p>In the accompanying seminars, the relevance of computational models for understanding the function of the brain is discussed using examples from recent research papers.</p>							
Objectives							
<p>basic cable and network modeling techniques; learning how to use NEURON (software for for empirically-based simulations of neurons and networks of neurons, http://www.neuron.yale.edu/neuron/); learning how to work on scientific questions based on relevant publications.</p>

			Contact study 11 SWH / 165 h		Self-study 165 h				
This module will not be offered in 2017/18.									
Content									
Core techniques of non-invasive human electrophysiology using a perceptual closure paradigm. Students will create their own stimuli (Mooney faces) from photographs. In doing this, student's will learn the difference between feature based perceptual processes and knowledge based perceptual processes. The created stimuli will be tested in psychophysical measurements (accuracy, reaction times, D', A'). After selection of optimal stimuli, we will proceed with MEG measurements using these stimuli. Students will have the opportunity to operate the MEG systems themselves. Students will learn how to analyse the recorded MEG data using the open source software package Fieldtrip (http://fieldtrip.fcdonders.nl/) and will have the opportunity to compare results to previous in-house studies using similar content.									
Objectives									
Knowledge on MEG signal generation and fundamental analysis techniques (event related fields, analysis of oscillatory activity), creating an experimental protocol using the software package „Presentation“, performing MEG measurements according to the Glasgow standards. Critical evaluation of the student's own results and comparison to the literature will be a central part of the Final protocol. Presentation of results in a scientific talk.

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>This practical course gives an overview of our research of the neural bases of higher cognitive functions, in the context of current projects in the areas of working memory, language processing, motion imagery and executive control functions. There may also be the opportunity to participate in developmental studies investigating neuro-cognitive development in primary school age. Depending on currently ongoing projects, the students can participate in neurocognitive studies (using techniques such as fNIRS, fMRI, EEG, or behavioral measurements) or in the area of signal processing of neurophysiological data. Aim of the practical course is to learn about the theoretical background of the projects, as well as data acquisition, data analysis, and interpretation of results. Students are encouraged to work independently.</p> <p>Students are expected to write a protocol documenting their work in the lab. In an ongoing seminar, recent studies form the cognitive neuroscience literature are discussed and students will have the opportunity to give a talk.</p>							
Objectives							
Cognitive and neurocognitive models, methods of experimental psychology, basics of acquisition and analysis of neurocognitive data. Learning how to work on scientific questions based on relevant publications.

INS C-8 Systems Neuroscience – Sensorimotor and cognitive networks	Neuronale Netzwerke	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The module introduces students on neural networks (cortical and subcortical) which are important for cognitive and sensorimotoric processing. A main focus lies in the investigation of hemispheric lateralisation, mainly concerning linguistic processing and motor control of movements of the hand. Healthy volunteers and patients are examined in view of their behavioral reactions and under use of electric and magneto-encephalographic techniques. In addition, electrocorticographic data are raised by patients during brain operations.</p> <p>The students get familiarized with the used methods and acquire knowledge on the organisation principles of neural networks. The students will work on a specific fMRI case study in the first week of the module and then carry out behavioral tests and imaging experiments independently or under instructions as well as visit weekly seminars.</p>							
Objectives							
Acquisition and analysis of human functional imaging or neurophysiological data (patients and/or healthy controls). Learning how to work on scientific questions based on relevant publications.

			Contact study 10 SWH / 150 h		Self-study 180 h			
Content								
<p>Neural networks exist to process information. This course provides the information theory necessary to understand neural information processing quantitatively. It takes an intuitive approach to information theory that is particularly suited for neuroscientist. To demonstrate the usefulness of information theory the course will start with introducing David Marr's classic three level hypothesis of understanding neural systems and demonstrates how information theory is essential to understand neural systems at the level of the algorithms they perform. The course will also detail some of the many links between information theory and Bayesian statistics. All information theoretic measures introduced in the course will be discussed by examples from the literature (measures include, response specific information, stimulus specific surprise, local transfer entropy und local active Information storage, excess entropy, maximum entropy principle). Course participants will have the possibility to apply information theory to their own or to example data using the open source software JIDT and TRENTOOL.</p>								
Objectives								
<p>Knowledge of the basic information theoretic measures, such as Entropy, mutual information, etc. and an intuitive understanding of their meaning. The course will also refresh knowledge of probability theory.</p>								
Requirements for participating								
<p>basic knowledge about probabilities</p>								
Helpful previous knowledge:

			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
Based on neuroanatomical data from recent advances in microscopy and genetic techniques, we will generate models with a main focus on dendritic and axonal interactions. We will use image processing tools and quantitative analysis methods in the computer to digitise various anatomic components from microscopy image stacks. In their digital form, measured geometric properties can be matched to corresponding biophysical principles. For example, we can observe and measure the formation of neural circuits during development by using time-lapse imaging series. The measured structure of dendrites and axons then enables conclusions about connectivity and function in those circuits. The observed principles will then be tested in simple quantitative models. The module <i>Computational Neuroanatomy</i> will therefore bridge the way from data analysis to the generation of a scientific theory using simple computer models.							
Objectives							
The participants will learn to handle biological data using quantitative methods (incl. the usage of Matlab). They will further learn to generate simple models that reproduce the trends observed in these data. The projects will be selected to match the current research focus in the lab.

INS C-11 Computational Modeling of Neuronal Plasticity	Computer-Modellierung neuronaler Plastizität	Elective module	11 CP = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>This lab course offers an introduction to the design and implementation of computer models of neural networks and the modeling of neuronal plasticity mechanisms. The course is a practical introduction to central methods of Computational Neuroscience, which investigates the functioning of the brain at multiple levels with the help of computational models. Participants implement and analyze standard neuron models and network architectures. The focus is on the role of plasticity mechanisms, their impact on network dynamics and their role in learning. The benefits and limitations of computer models for understanding brain function are discussed in the context of examples from the literature. Participants present their results in a talk and prepare a final report.</p>								
Objectives								
<p>Participants learn how to implement computer models of neural networks as well as different plasticity mechanisms and learning approaches. They learn to address a scientific question in the context of relevant literature.</p>								
Requirements for participating								
<p>Please consult with „Modulverantwortlichen“ regarding prerequisites.</p>								
Helpful previous knowledge:								
<p>Programming abilities in at least one programming language (e.g. Python, Matlab, Java) Background in a quantitative discipline (e.g. Physics, Mathematics, Computer Science or Engineering). Basic knowledge in the areas lineare algebra, probability and statistics, differential equations, numerical methods.</p>								
Assignment of module (course/department)			Interdisciplinary Neuroscience / FB15					
Suitable for other courses								
Times offered			Twice per year, summer semester					
Duration			4 weeks					
Person in charge			Prof. Dr. Jochen Triesch					
Confirmation of completion								
Participation			Regular participation					
Course assessment			1 seminar presentation on the results of one's own experiments, work report					
Teaching forms			Practical, self-study					
Tuition language			English					
Module exam			Form / duration / content (if applicable)

INS C-12 Computational neural dynamics	Rechnergestützte neuronale Dynamik	Elective module	11 CP (insg.) = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>Our aim will be to understand how connectivity and the spiking dynamics of individual neurons interact to give rise to complex collective phenomena such as information transmission, oscillations, or wave emergence in a neural network. We will use spiking neurons in computer simulations and pen-and-paper calculations to predict the dynamics emerging in a given network. Specifically, the students will write own code and will mostly work on new, open scientific problems that are not part of the textbook knowledge. The module Computational neural dynamics will therefore teach students to formulate own models, learn to solve or simulate these models, and teach them how to evaluate the findings and compare them to known biological observations. Among the effects, which we will include in the spiking network models, will be synaptic plasticity, firing rate adaptation, or different connectivity profiles.</p>								
Objectives								
<p>The participants will learn how to solve differential equations and write own computer code, e.g. in Python, C or Matlab. They will learn how to distill minimal theoretical models from physiological observations and published research. The student projects will be aligned with the ongoing research in the Tchumatchenko lab.</p>								
Requirements for participating								
none								
Helpful previous knowledge:								
Previous knowledge in physics, mathematics or informatics and coding

INS C-13 Models for Neural Circuit Development	Modelle der Entwicklung neuronaler Schaltkreise	Elective module	11 CP (insg.) = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>This module will focus on understanding the principles guiding the formation of sensory maps and receptive fields during the development of sensory circuits. The students will obtain an overview of existing models of the development of topography, ocular dominance columns, orientation and direction selectivity in the visual cortex. We will examine how different mechanisms including: emergence of diverse single neuron properties and activity-dependent synaptic plasticity interact during development to give rise to functional circuits. In addition to synaptic plasticity, which is more commonly studied, the focus will be on the role of the specific biophysical properties at the single neuron level. The students will have the opportunity to analyze (electrophysiological or Calcium imaging) data from visual cortex and build their own models of the assembly and tuning of developing neuronal circuits.</p>								
Objectives								
<p>Students will learn to analyze and interpret neural data, build and simulate computational models (e.g. in C, Matlab, or Python), and analyze model results in relation to experiments. Acquired skills include: statistical analysis, computer programming and simulations.</p>								
Requirements for participating								
None								
Helpful previous knowledge:								
Some programming experience and background in a quantitative discipline (physics, mathematics, engineering, informatics).

INS C-14 Cognitive Psychology – Attention, Perception & Memory	Kognitive Psychologie – Aufmerksamkeit, Wahrnehmung und Gedächtnis	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>This practical course provides an introduction to conducting research in Human Cognitive Science also known as Cognitive Psychology. In particular, students taking part will be able to gather hands-on experience in designing, programming, executing and analysing experiments in the areas of visual attention, scene perception, and memory. Depending on currently ongoing projects in the “Scene Grammar Lab”, the students can participate in neurocognitive studies using techniques such as EEG, eye tracking (both stationary and mobile ET glasses), and/or psychophysics. At the end of this practical course the students will have learned about the theoretical background of the projects, as well as data acquisition, data analysis, and interpretation of results. While we expect the students to work independently, the various members of the lab will be there to help where possible.</p> <p>As part of our weekly lab colloquium, students will be able to learn about other ongoing projects and will have the opportunity to present their work in this informal setting. At the end of the course, students are expected to write a brief paper (intro, methods, results, discussion) on the study they were working on.</p>							
Objectives							
Reading up on theoretical backgrounds in the field of attention, perception, and memory, learning methods of experimental psychology, basics of acquisition and analysis of (neuro-)cognitive data, performing basic statistical analyses and writing a scientific paper.							
Requirements for participating							
none							
Helpful previous knowledge:							
Basic knowledge in Matlab/Python, as well as statistical analyses using R. Looking at our webpage beforehand might also be helpful: www.SceneGrammarLab.com .

Elective Modules Subject Area D: Applied Aspects of Neuroscience

INS D-0 External Practical Module “Applied Aspects of Neuroscience”	Externes Praxismodul „Angewandte Aspekte in den Neurowissenschaften“	Elective module	11 CP = 330 h				11 SWH
			Contact study 11 SWH / 165 h		Self-study 165 h		
Content							
<p>The practical provides basic methods and technologies in the area of applied aspects of neurosciences. The students work on own projects under instructions and introduce the results in the form of a seminar talk. They learn how to present scientific work through writing up an appropriate result protocol.</p> <p>The module can be offered by departments of the Goethe university, from other universities in Germany and foreign countries as well as by external-university research facilities.</p>							
Objectives							
The students gain knowledge in the realisation of experiments in the area of applied neurosciences. They learn working independently on scientific questions based on relevant publications.

INS D-1 Behavioral Biology in Zoos	Verhaltensbiologie in Zoos	Elective module	11 CP = 330 h				11 SWH	
			Contact study 11 SWH / 165 h		Self-study 165 h			
Content								
<p>The module consists of a seminar, an internship and excursion. Fundamental aspects and current issues of Zoology are taught in the seminar at the beginning based on original work, which will be presented by the students and then discussed as a group. The excursion to various zoos and a research internship in the 'Opel Zoo' serve to solidify theoretical principles. The focus will be on ecological, physiological and ethological research. Other topics include: historical development of zoos, zoos & conservation, population biology & breeding programs at the zoo, animal husbandry (nutrition, behaviour, enrichment, mixed species exhibits), veterinary fundamentals, organization and structural development, enclosure design and planning, education at the Zoo. The methodological approach to the practical components depends on the selected research focus, with classical to modern methods of behaviour research available. They may include laboratory activities (microscopic and physiological studies) and imaging techniques (such as thermographic measurements with infrared cameras or video analysis with high-speed cameras).</p> <p>The students present their results at the end of the module in the form of an oral presentation. In a further lecture they learn to critically appraise original work at the 'Opel Zoo'. These presentations will be held in English and students are given detailed feedback in terms of content and structure. By drafting a protocol in the form of a paper they become acquainted with the writing of a scientific publication. Following a detailed briefing on the methodology, planning, implementation, logging and analysis of the original data will be completed by the students independently.</p>								
Objectives								
<p>The students acquire basic principles in the field of zoo biology (behaviour research in the zoo, enrichment, husbandry, conservation aspects), as well as the application of modern imaging techniques. You will learn methodology for the implementation of behavioural studies and how to address scientific problems while bearing in mind current concepts in the relevant literature.</p>
